# Verify, validate and aggregate supplier information with **Supplier Verification**

During the onboarding process, a significant amount of data provided by each supplier needs to be either externally validated or enhanced. Automated verification and validation techniques offer a range of advantages over traditional manual checks, such as saving time and resources, improving accuracy and consistency, increasing coverage and depth, enhancing traceability and documentation, and facilitating collaboration and communication.

The Supplier Verified hub collects information added by suppliers into your SAP Ariba SLP, SAP MDG or SAP ERP platform and conducts those checks automatically through pre-built integration points via real-time service calls. After the checks, the platform returns a positive or negative result and enriched information. Examples of information that can be checked are address and tax numbers, bank information, ESG ratings data, material disclosures and accreditations. Examples of data enrichment include supplier risk profiles and scores and additional data fields to support compliance checking.

Five reasons to automate **Supplier Verification**

Streamline your business processes
Reduce the admin burden on business approvers and compliance departments and the inaccuracy of manual checks

Establish a single data model
Aggregate your ESG and supply chain compliance data into your Source to Settle platform, removing data silos and the need for additional standalone solutions

Mitigate fraud
Eliminate supplier errors, through automated checks during onboarding, with integrated 3rd party data (EcoVadis, D&B, SEDEX, ISNetworld, GIACT)

Make Procurement & Supply Chain a valued Business Partner
Leverage the single data model to make informed and fast decisions and ensure compliance with both legislative and internal sustainability initiatives

Strengthen the verification process with the use of digital signatures
Have company directors digitally sign off policies, risk assessments, carbon accounting data to build more trust and integrity

Supplier Verified Hub Overview

Verify and enrich supplier data through online real-time service calls

Information added by suppliers is checked in 3rd parties automatically through online real-time service calls. After the checks, the Supplier Verified application returns a positive or negative result to SLP as well as enriched information.

Integration with DocuSign also allows for collection of document signature in the process.

SAP Ariba

SLP

Supplier → Submit Registration Questionnaire → Approval task triggered → Return "match" or "no match" and enriched data

API

Supplier Verification Hub using BTP

Formats the request for verification → Parses validation result → Sends update to SAP Ariba
